

A Review of the Search and Product Discovery Experience

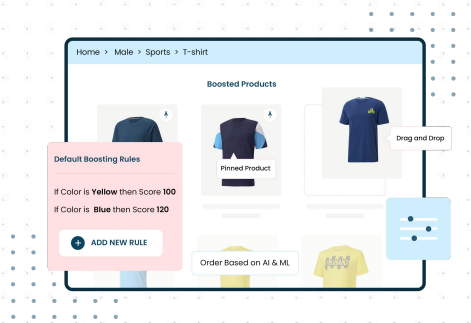

Product Discovery Suite

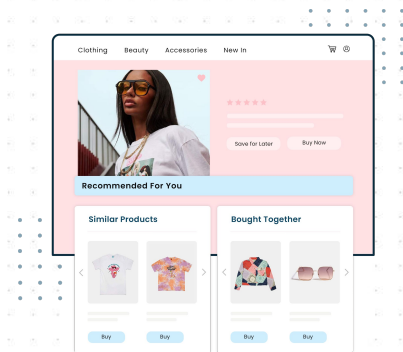

Smart Search

Klevu Smart Search is a powerful and extensible ecommerce search solution that delivers search results based on shopper intentions and behaviour, all in real-time.

Smart Category Merchandising

Take shopping experiences to the next level with our AI-powered algorithm which automatically optimises the ranking order of products on category pages.

Smart Recommendations

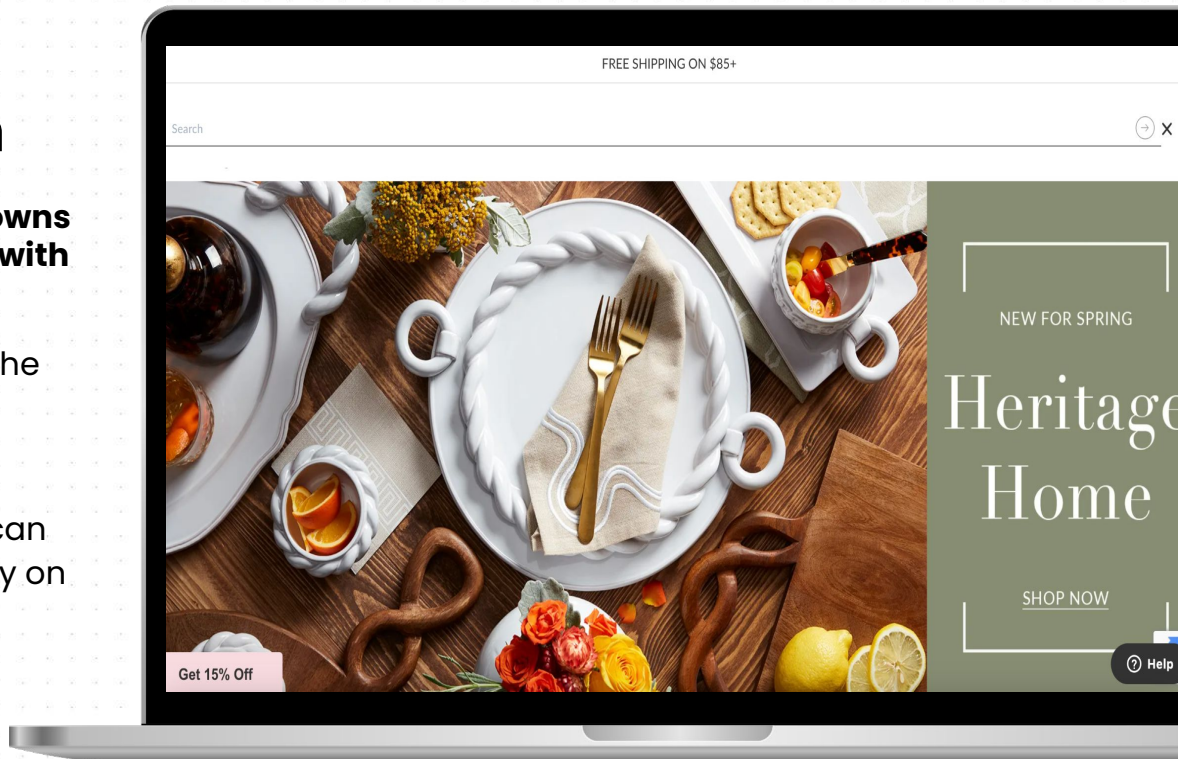

Leverage Klevu machine-learning to power sitewide recommendations, including homepage, collection page, PDP, and checkout page.

Zero Character Search

More possibilities such as adding dropdowns for zero character searches can be done with Klevu.

Over 40% of shoppers go immediately to the search bar when on a new website, this is especially relevant on mobile.

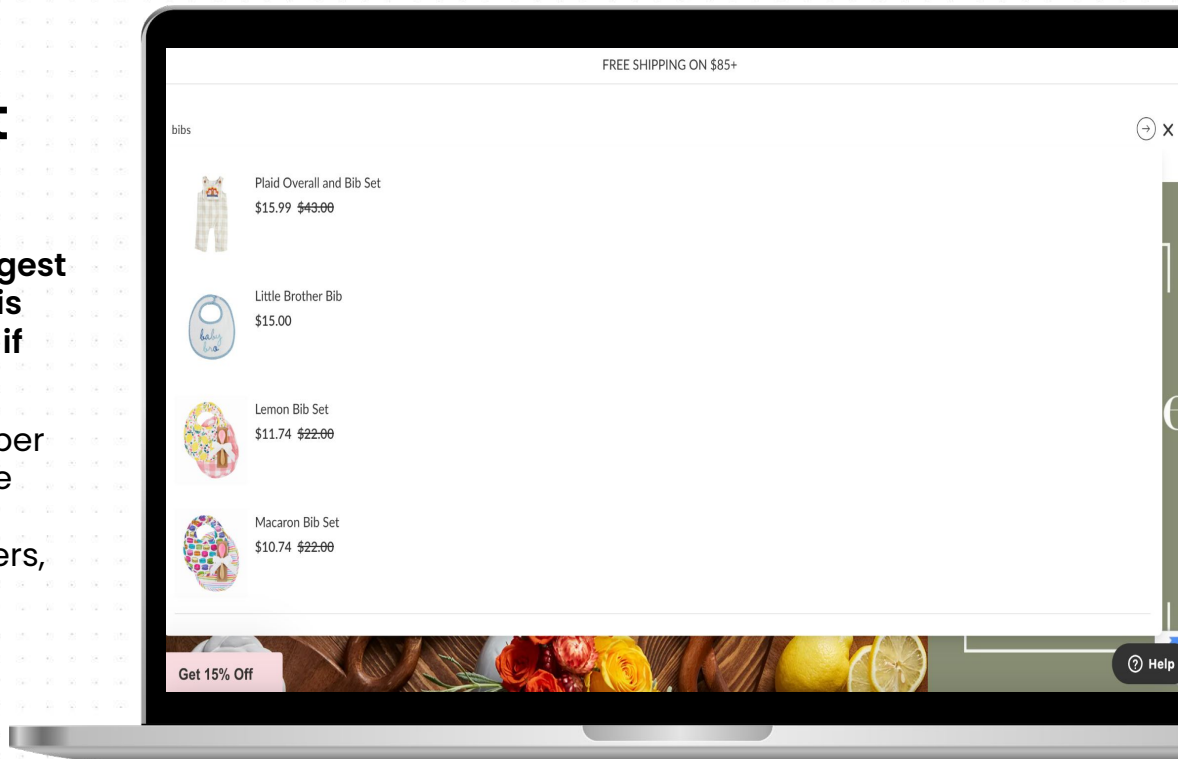

Exposing the search bar on your website can lead to a 44% increase in orders, especially on mobile.

Add rich auto-suggest on search overlay

Mud Pie currently has a limited auto-suggest function. Klevu will be able to enhance this and even add filters within auto-suggest if desired.

For an optimum experience, when a shopper begins typing, show rich content within the search overlay including product recommendations, text, images, price, offers, and content -- even on mobile. Doing this increases search-led conversion by 54%.

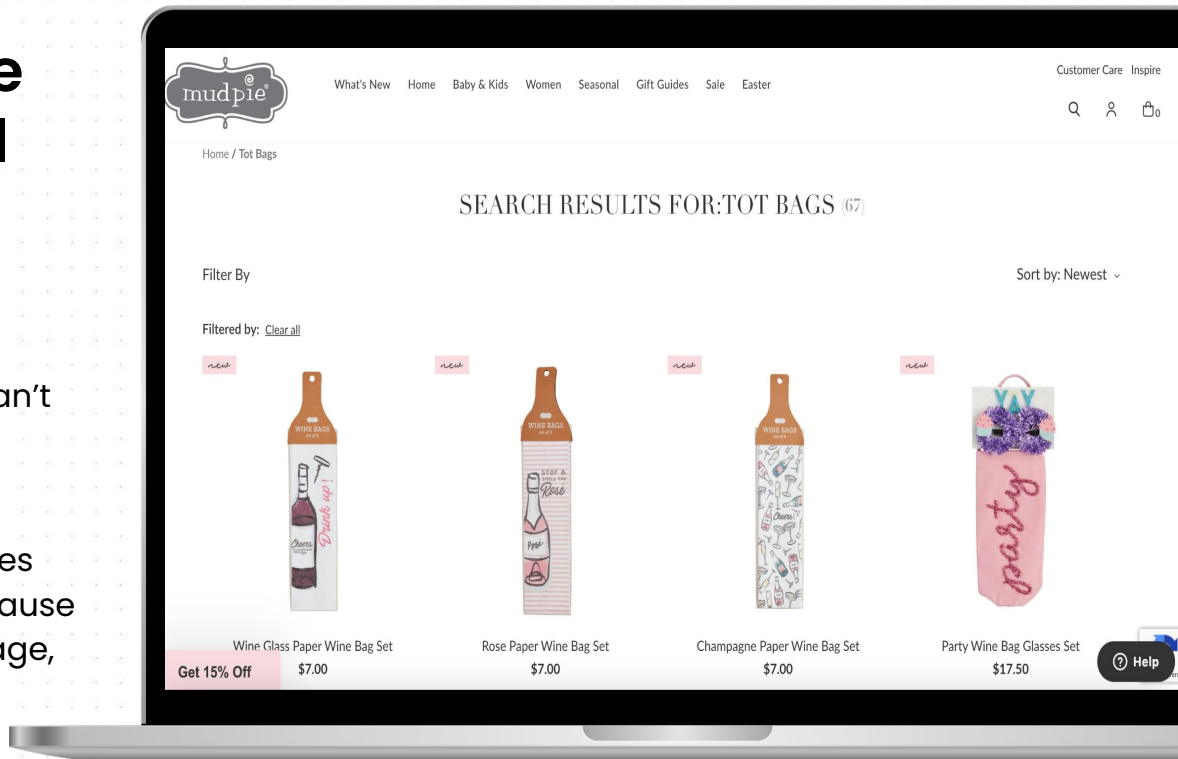

Making sure results are relevant and typos still drive revenue

A search for “Tot Bags” shows irrelevant results.

Shoppers will abandon a website if they can't find what they are looking for, even if they misspelled it!

For 56% of retailers, their search experiences are just not surfacing stock they have because of simple typos. Processing natural language, including mistakes, is vital to improving conversion rates.

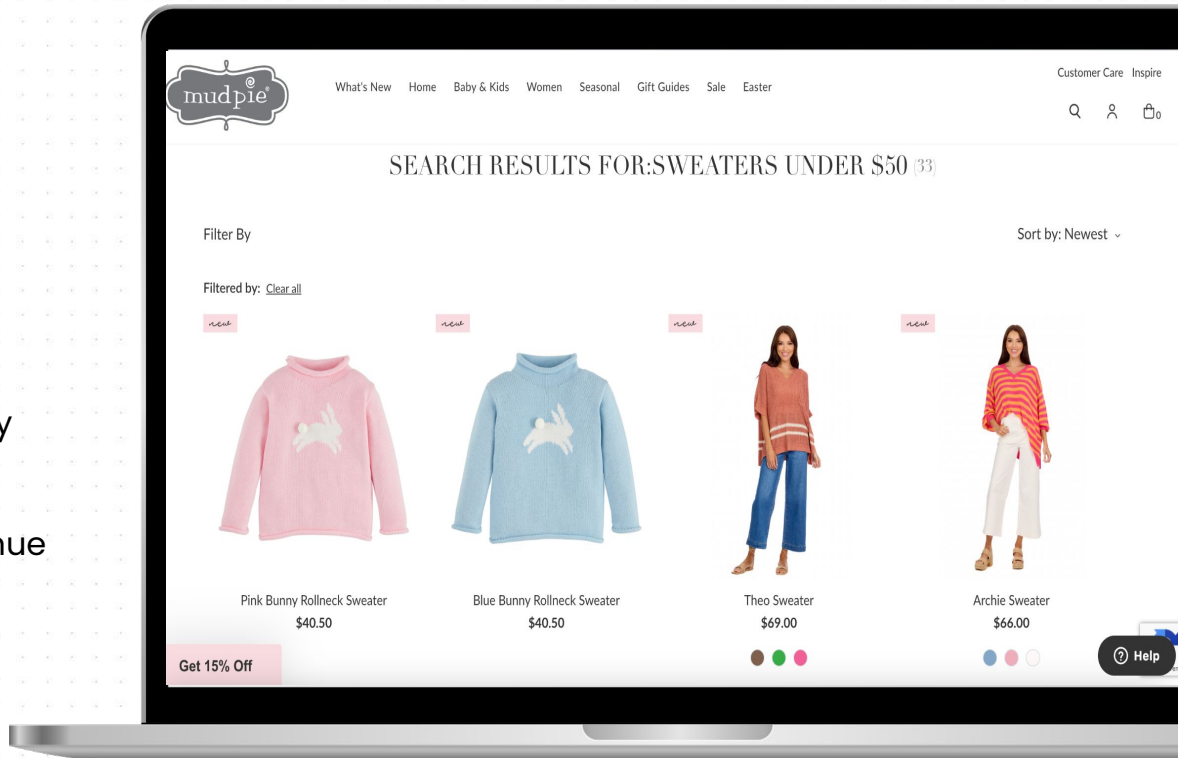

Add natural language processing to search

“Sweaters under \$50” only returns broad results.

NLP helps search engines process what shoppers mean, rather than just what they search for.

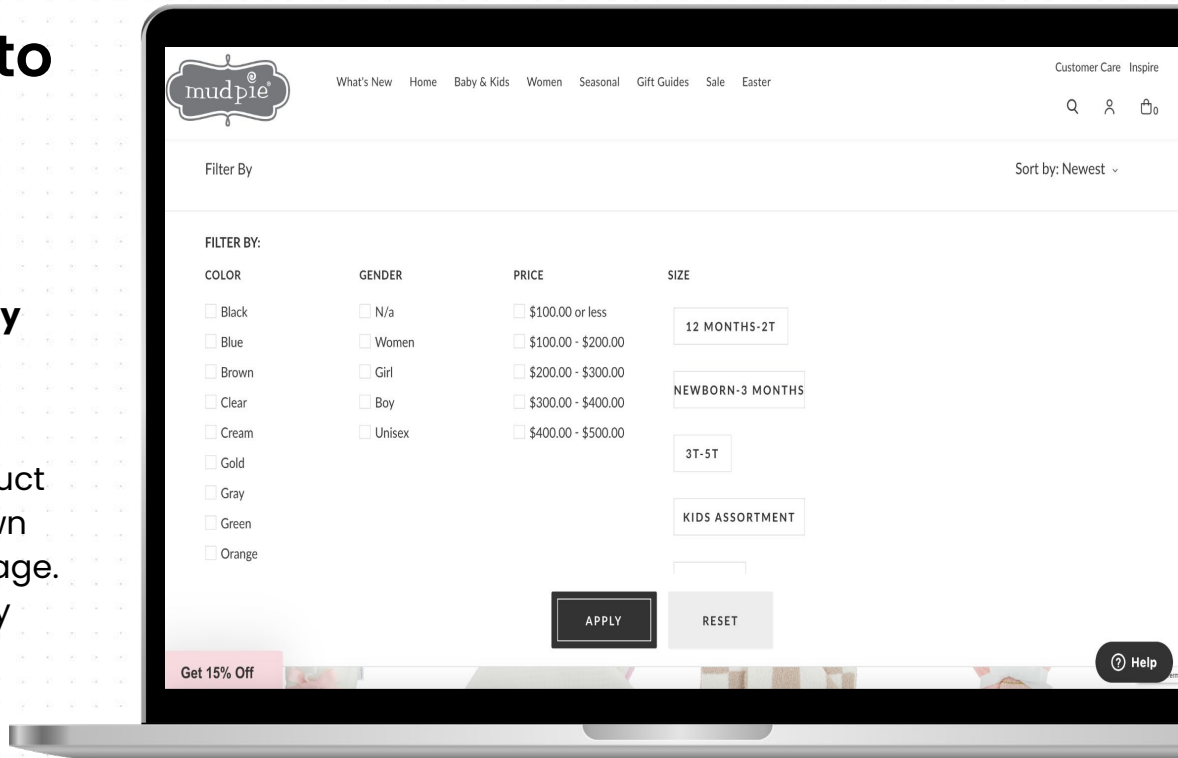

Adding this will result in measurable revenue gains – an increase of 12% in search-led conversion, and brand affinity uplift.

Add dynamic filtering to search and category pages

Mud Pie has a set of filters on the category and search pages.

Adding filters on the search and category pages that are super relevant to the product set allows shoppers to quickly narrow down their options without leaving the results page. By doing this, conversion rate increases by at least 5%.

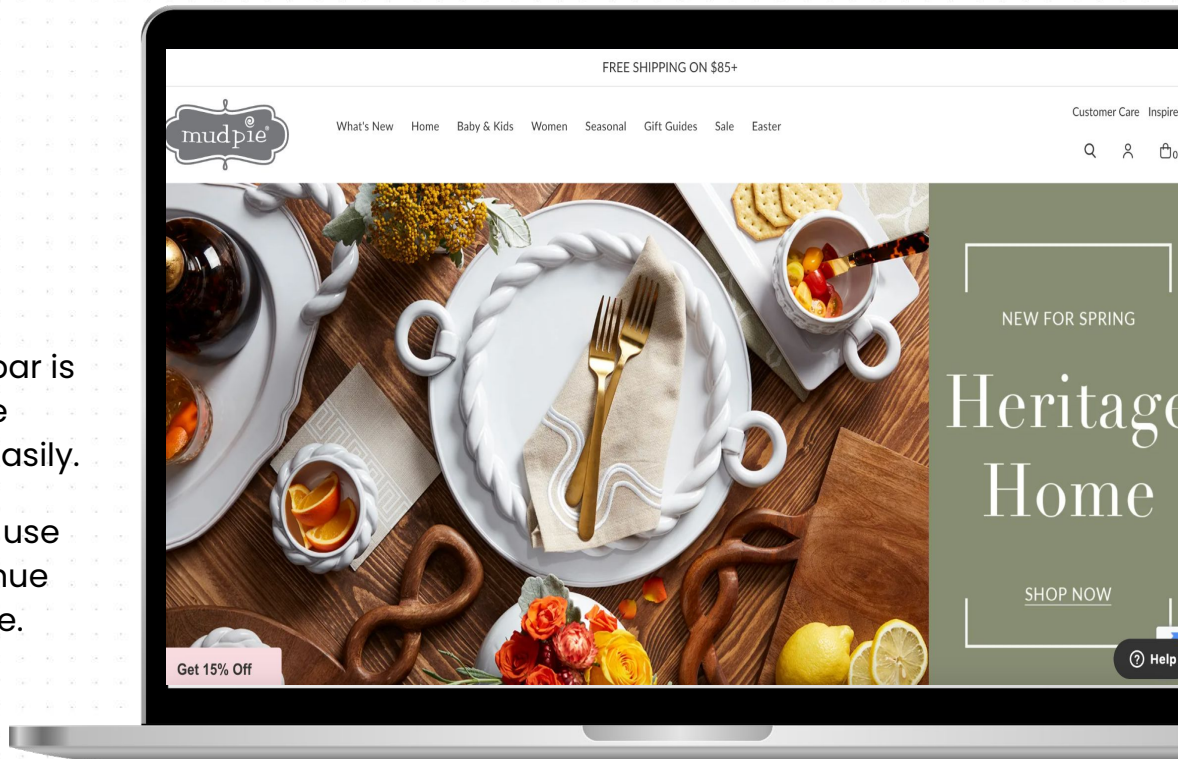

Make blog and other content searchable

Mud Pie doesn't show pages and other content in product results.

Making blog content or other reading materials accessible through the search bar is a great way to provide customers with the information they are searching for more easily.

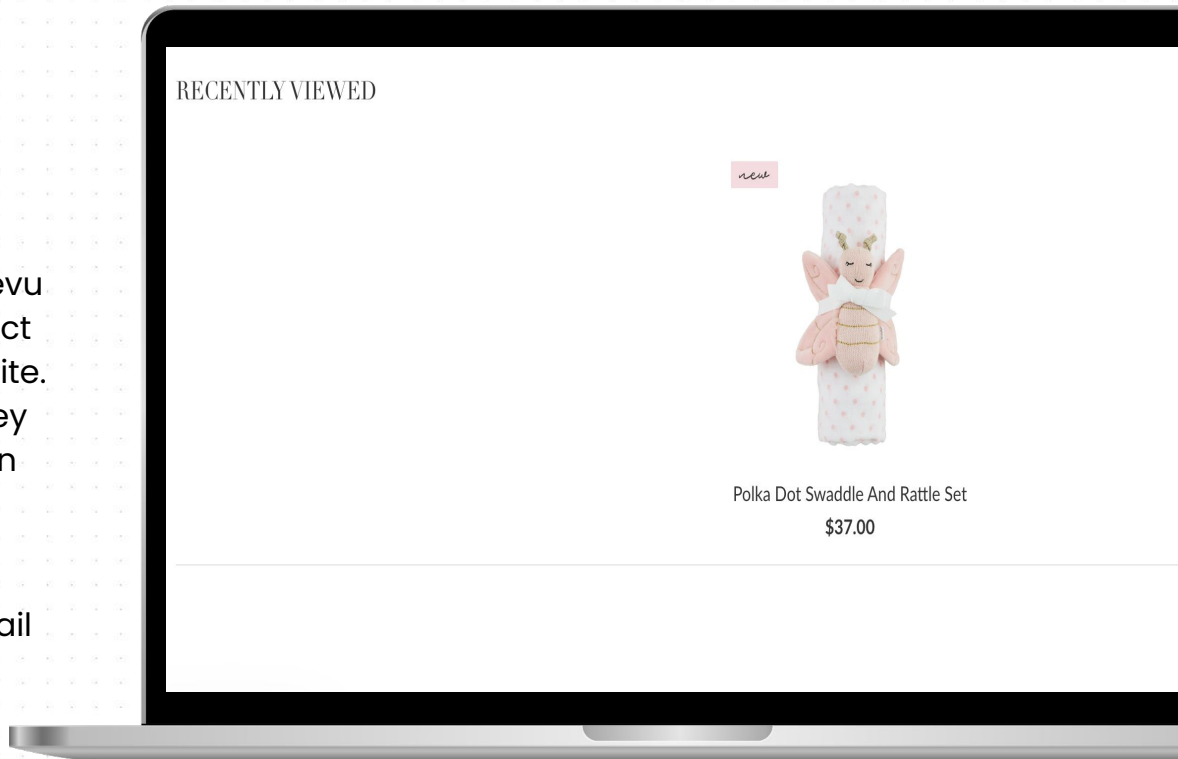

Doing this could lead to a 36% increase in use of search, 8% increase in search-led revenue and 21% increase in search conversion rate.

Add dynamic product recommendations banners site-wide

Mud Pie shows “Recently Viewed”. With Klevu you can show more than one set of product recommendations anywhere on the website. Recommendations will be dynamic, so they change depending on shopper behavior in real-time.

Klevu can help you add more recommendation widgets on product detail pages, the home page, and more based on trending and 1-2-1 personalisation.
